Lesson objective:

- To allow students to investigate the raw wool fibre more closely.
- To draw out questions from students about how the physical (observable) features of greasy (raw) wool make it a useful for a range of everyday products.

Students will have the opportunity to:

- explore and make shared observations about the wool fibre
- gain an appreciation of how the physical properties of the wool fibre contribute to the final properties of the wool product.

Setting the context

The wool fibre has a number of structural features that give wool its unique properties as a fibre and textile. The diameter (micron) of the wool determine how fine the final yarn and fabric will be, the crimp (wave) gives wool its natural insulation properties.

The grease that surrounds each wool fibre (lanolin) is removed during processing and used in a range of beauty products.

Each wool fibre is covered in tiny scales, which are important in making felts and traditional wool cloth.

Lesson focus

The focus of this lesson is to spark students’ interest, stimulate their curiosity, raise questions for inquiry and gain an understanding of their existing beliefs about wool. These existing ideas can then be taken account of in future lessons.

Introduction

Review the class journal descriptions from Lesson 1 and discuss the observations students made about the wool products they explored during this lesson.

Ask students what they can remember about wool from the previous lesson (e.g. “where does wool comes from?”). Record their answers in the class journal under the heading What we know about wool. If necessary, remind students wool is a natural fibre produced by sheep.

Body of lesson

1. Explain to students that wool has some unique features, called ‘properties’, which help protect sheep in all kinds of weather (review from Lesson 1 the meaning of ‘properties’). Play the Sam the Lamb —What is wool? video. Discuss with students what kinds of properties they think wool might have? Encourage discussion by asking questions like:
   - “How does wool protect sheep from cold weather?”
   - “How does wool protect sheep from wet weather?”

2. Show students the Wool production in Australia poster and explain the red and green areas are where most of the sheep in Australia are kept for wool production.

   Discuss with students the types of weather common in these areas during different seasons: for example, Tasmania is very cold in winter, central NSW is very hot in summer.

   Ask students what sort of conditions sheep might need protection from during the seasons (e.g. sun, wind, rain, snow).

   Explain that their wool fleece has properties that help protect sheep from all these weather conditions.

   Explain to students they are going to have a closer look at samples of raw (greasy) wool, share their observations with the class and record them using drawings and words.

3. Distribute to students the Looking at wool more closely worksheet. Ask students to predict what they think wool looks like up close and draw their predictions in the table on the worksheet under the heading ‘Before a close look’.

4. Allow students to explore the raw (greasy wool) fibre sample provided in the hard copy LEARN ABOUT WOOL kit, or a wool fleece if you have been able to access one.

   Encourage students to try and stretch a section of the wool staple and feel how strong the fibre is. Ask if they can see the wrinkles (crimp) in the wool staples or whether the wool feels greasy.

   Ask students to share their observations as they explore the raw fibre. Encourage them to describe the way the items look, feel, and smell. Add the students’ descriptions to the class science journal under the heading Looking at wool more closely.
Lesson 2: Wool — taking a closer look
Foundation year science
Properties of wool

5. Using the information on the How wool grows and Inside a wool fibre factsheets and the Structure of a wool fibre poster as a reference, explain to students the how physical properties of wool they have just been exploring including: the crimp (waves), the staple (it’s length and strength) and the lanolin (grease) all help protect the sheep from the weather.

6. Ask students to compare and describe the differences between their own hair and the samples of raw wool they have been investigating. Draw students’ attention to the Did you know? and Fun facts on the How wool grows and Inside a wool fibre factsheets, which compare human hair and wool. If possible, display these factsheets on a smartboard or screen for the whole class to see.

7. Allow students to explore further the wool fibre using a magnifying glass and/or microscope and ask them to draw what they see on their worksheets under the heading After a close look. Help students apply basic labels to their diagrams including: wool staple (as a heading) and crimp (to indicate the waves).

8. Discuss how the features of wool they have been investigating in this lesson might relate to the wool items they investigated in Lesson 1 (e.g. if wool helps to keep sheep warm when it is cold and cool when it is hot, wool clothing can do the same for people).

Conclusion

Play the video The innovator. Ask students to think about the types of weather conditions and activities in which they might choose to wear wool. Encourage students to explain their choices. Note students’ response in the class journal.

Explain that during then next few lessons you will be investigating further the unique properties of wool and how these properties influence the way we used wool in a range of everyday products.
